

**EXTREME AND ABSOLUTE AVERAGE AIR TEMPERATURES FROM THE
CRIȘUL REPEDE HYDROGRAPHIC BASIN**

Ana Cornelia Moza*, Mariana Popovici*

Abstract

This parameter helps to fully characterize the climate and indicates the actual limits between which the values of air temperature vary in a certain region, thus being very important from a practical, as well as theoretical point of view. The extreme temperature may be: annual, absolute and medium.

Air temperature represents one of the most important climate factors, presenting spatial and temporal modifications as a result of the interaction between the climate factors. The thermic regime of the Crișul Repede hydrographic basin is formed under the influence of characteristics of atmospheric circulation, radiative factors and the subiacent surface.
