Abstract

This paper analyzes the expansion of sanitation services in rural areas after the closure and rehabilitation of rural dumpsites having as deadline July 16, 2009. Following this period local authorities are forced to collect and dispose the waste generated in urban landfills from proximity until the transfer stations will be operational. Most of the rural population has no access to waste collection services, waste generated and uncollected are uncontrolled disposed polluting the local environment. Development of sanitation services is a basic condition for an efficient implementation of integrated waste management system at county level.

Keywords: sanitation services, dumpsites, waste management,rural areas

INTRODUCTION

The improper sanitation services lead to illegal dumping of waste from various geographical regions (Chen,2010;Ichinose and Yamamoto,2011; Apostol and Mihai,2011).Sanitation services are poorly-developed and partially covering rural regions in Romania (Apostol and Mihai,2012). Waste generated and uncollected from urban and rural areas are uncontrolled disposed polluting the local environment (Mihai et al., 2011)

In rural areas were done very few studies on waste management until 1990 , the literature does not have conclusive data (Bularda e al.,1992).Also,waste generated from rural localities are not subject to waste statistics in Romania, because they are difficult to follow in the context of limited acces to sanitation services.(Bold and Maracineanu,2003,Bold, 2006)

Following 1990, governmental programs have neglected the issue of waste management infrastructure regarding the collection and recycling (Vadineanu,1998). Waste issue from Romania's rural territory is not governed by the authorities (Wehry and Orlescu,2000). The "Agenda 2000" document which has been analyzed Romania's EU accession outlines the lack of a waste management system (Nicoara,2009). Environmental policies on waste management has took the scale only in the context of Romania's EU accession.

Frequently,bad practices on waste managemnet lead to complex pollution(Ungureanu,2005).Agricultural production potential of large areas of soil is blocked by covering areas with mining dumps, landfills or animal

manure (Ungureanu et al., 2003). Scarcity of data on waste management from rural areas makes difficult a pertinent analysis at regional or local level.

MATERIALS AND METHODS

Analysis of the territorial extension of waste collection services from rural areas was performed using thematic cartography. There were consulted the annual reports of EPAs Neamț, county waste management plans and data supplied by the Environmental Guard, County Commissariat or local authorities from rural areas. Also based on thematic maps a comparative analysis is performed between the first regional approach of waste management at county level described in territorial planning from 1996 and the integrated system of solid waste management that will be implemented. Field observations in the period 2009-2011 are intended to highlight the positive and negative changes of waste management in rural areas.

RESULTS AND DISCUSSION

During 2000 -2003 only Roznov and Săvinești communes had their own sanitation services, waste collected being disposed in open dumps (eg. municipal and non-hazardous industrial landfill from Savinesti village) or on floodplain of Bistrița river. Although in 2004 Roznov was declared city, the population did not have access to sanitation services in the period 2004-2010 ! In 2005, the population served by sanitation services is 38% of the total number of inhabitants in the county, the urban coverage rate is 79% while in rural areas only 12% (APM,2006). Waste collection services of urban areas have expanded their activity in the rural areas from neighborhood including 8 communes in 2006. (PJGD, 2008) However, in 2007, the share of population served with sanitation services in urban areas was 62.70% and only 9.08% in rural areas. Limited access of rural population to sanitation services has led to uncontrolled disposal of waste. Local authorities have chosen some sites where the waste could be disposed. Sanitation services were not well organized and waste collection did not occur regularly. Often rivers are assigned the position of collector for various types of waste (Mac, 2003). Rivers in the proximity of human settlements from mountain or subcarpathian regions are most vulnerable to waste pollution because the lacking of sanitation services. Following July 16, 2009 under EU rules, municipalities are obliged to close the dumpsites on their range and to sign contracts with waste operators or to provide own services.

Waste collected should be transported to urban landfills (Roman or Târgu Neamț) until the transfer stations will become operational (fig.1) This explains the more communes number served by waste collection service in

2009 compared to 2006. It is noted that most communes benefit from these services after July 16, 2009 and in general only a fraction of the population is served

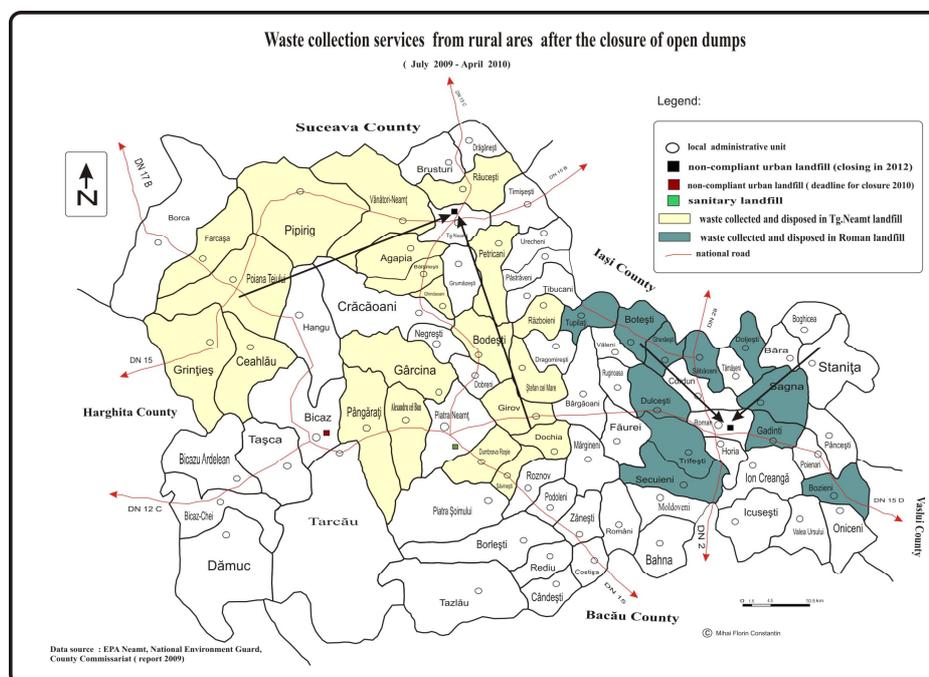

Fig.1 The expansion of waste collection services on rural territory

In some communities (eg Agapia, Bălățești etc) although lacking of waste containers, local authorities provide waste collection from households monthly or weekly in bags, being transported to Târgu Neamț landfill. Sanitary landfill from Piatra Neamț built with ISPA funds does not allow the landfilling of the waste collected from rural areas, these site serving only territorial administrative of Piatra Neamț city (including 3 rural communities such as Doamna, Văleni and Vânători). In this context, waste collected from peri-urban communes (Dumbrava Rosie, Girov, Gârcina, Alexandru cel Bun) are transported to non-compliant landfill of Târgu Neamț city. Thus, the cost of sanitation services is higher due to transport. Mixed waste collection prevails, separate collection is rarely seen and generally the only plastic is collected. However, in 2011 separate collection containers were installed for plastics, paper / cardboard, biodegradable and residual waste in Piatra Soimului and Borlești communes (fig 2).

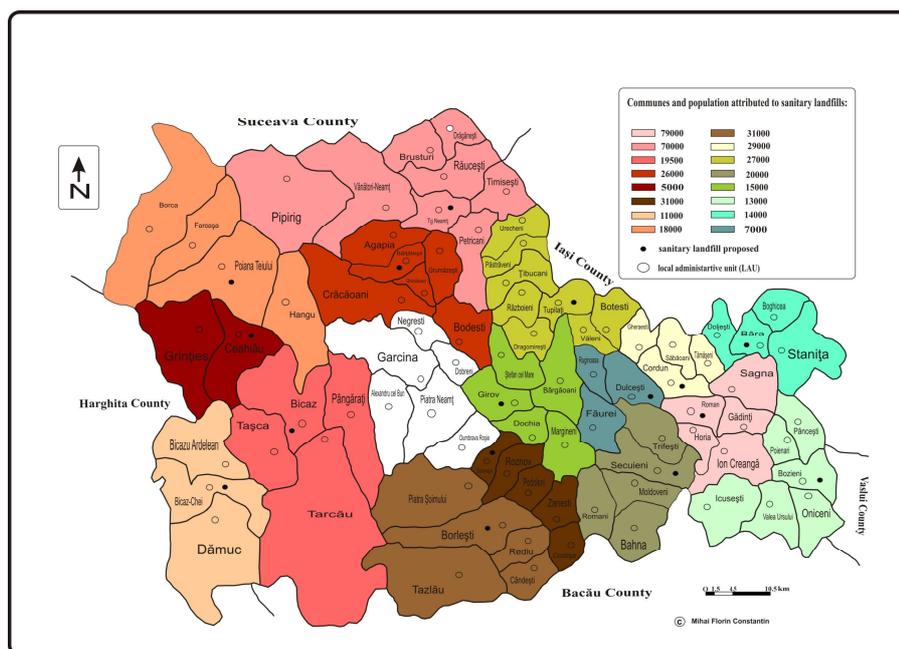

Fig.2 Proposals for sanitary landfills in territorial planning of Neamț County from 1996

Territorial Planning of Neamț County (PATJ) was established in 1996, proposing facilities for water supply systems, sewerage systems and landfills (PJGD,2003). This plan (fig.2) presented for the first time a regional approach of waste management issue but did not include all rural localities from county.

Another deficiency of this proposal is the small number of people subordinated to a sanitary landfill - between 5000 - 31.00 people (except the Roman and Târgu Neamț cities), which does not ensure the economic viability of these waste management systems. The integrated solid waste management system provides the construction of three transfer stations equipped for sorting and separate collection of waste. These facilities will be located in cities or in peripheral communes (Târgu Neamț, Roznov and Cordun commune near Roman city) and will receive the waste collected from rural localities (fig.3) Waste that can not be recovered will be disposed of in sanitary landfill located in the commune Girov. It is noted that sanitary landfill from Piatra Neamț city will be operational until 2017, following this term the waste will be disposed in Girov landfill.

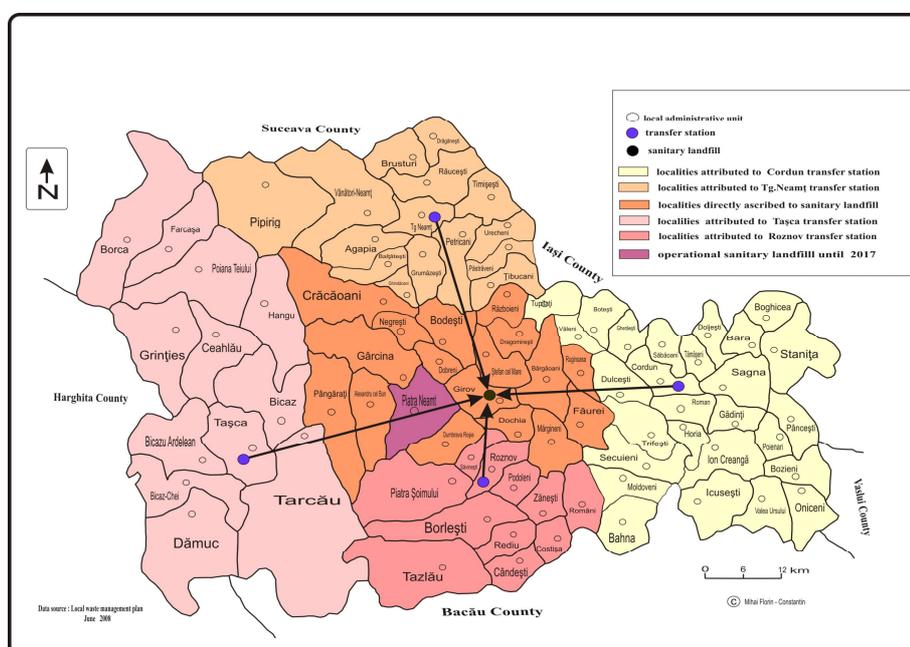

Fig.3 The future integrated solid waste management system at county level

CONCLUSIONS

Partially access of the rural population to waste collection services lead to illegal dumping of household waste generated and uncollected polluting the environment in the proximity of human settlements. Poor solid waste management facilities encourages the bad practices such as open dumping or uncontrolled disposal on rivers banks, local roadsides or forest areas. Sanitation services on rural territory is emerging under the pressure of EU regulations.
